preface xv

chapter one: An overview 3

- 1.1. The basic categories: Actors, behavior, institutions, and equilibrium 3
- 1.2. The purpose of microeconomic theory 7
- 1.3. Scope, detail, emphasis, and complexity 10
- 1.4. A précis of the plot 12

part I: Individual and social choice

chapter two: The theory of consumer choice and demand 17

- Prologue to part I 17
- 2.1. Preferences and choices 18
- 2.2. Marshallian demand without derivatives 37
- 2.3. Marshallian demand with derivatives 51
- 2.4. Aggregate demand 62
- 2.5. Bibliographic notes 63
- 2.6. Problems 65

chapter three: Choice under uncertainty 71

- 3.1. Von Neumann-Morgenstern expected utility 72
- 3.2. On utility for money 81
- 3.3. Applications to market demand 87
- 3.4. States of nature and subjective probability 98
- 3.5. Problems with these models 112
- 3.6. Normative applications of the theory 120
- 3.7. Bibliographic notes 122
- 3.8. Problems 124

chapter four: Dynamic choice	133
4.1. Optimal dynamic strategies	133
4.2. Menus and meals	139
4.3. Bibliographic notes and discussion	143
4.4. Problems	146
chapter five: Social choice and efficiency	149
5.1. The problem	149
5.2. Pareto efficiency and optimality: Definitions	153
5.3. Benevolent social dictators and social welfare functionals	156
5.4. Characterizing efficient social outcomes	164
5.5. Social choice rules and Arrow's possibility theorem	174
5.6. Bibliographic notes	181
5.7. Problems	182
 <i>part II: The price mechanism</i>	
chapter six: Pure exchange and general equilibrium	187
Prologue to part II	187
6.1. Pure exchange and price equilibrium	187
6.2. Why (not) believe in Walrasian equilibrium?	193
6.3. The efficiency of a general equilibrium	199
6.4. Existence and the number of equilibria	205
6.5. Time, uncertainty, and general equilibrium	216
6.6. Bibliographic notes	223
6.7. Problems	225
chapter seven: The neoclassical firm	233
7.1. Models of the firm's technological capabilities	234
7.2. The profit function	239
7.3. Conditional factor demands and cost functions	250
7.4. From profit or cost functions to technology sets	253
7.5. Cost functions and π -runs	255

7.6. Bibliographic notes	259
7.7. Problems	259
chapter eight: The competitive firm and perfect competition	263
8.1. A perfectly competitive market	264
8.2. Perfect competition and -runs	267
8.3. What's wrong with partial equilibrium analysis?	279
8.4. General equilibrium with firms	283
8.5. Bibliographic notes	292
8.6. Problems	292
chapter nine: Monopoly	299
9.1. The standard theory	299
9.2. Maintaining monopoly	302
9.3. Multigood monopoly	304
9.4. Nonlinear pricing	306
9.5. Monopoly power?	314
9.6. Bibliographic notes	317
9.7. Problems	318
chapter ten: Imperfect competition	325
10.1. The classic models of duopoly	325
10.2. Bibliographic notes and discussion	340
10.3. Problems	347
 <i>part III: Noncooperative game theory</i>	
chapter eleven: Modeling competitive situations	355
Prologue to part III	355
11.1. Games in extensive form: An example	356
11.2. Games in extensive form: Formalities	363
11.3. Games in normal or strategic form	376

- 11.4. Mixed strategies and Kuhn's theorem 380
- 11.5. Bibliographic notes 384
- 11.6. Problems 385

chapter twelve: Solution concepts for noncooperative games 387

- 12.1. Opening remarks 387
- 12.2. Dominance and iterated dominance for normal form games 393
- 12.3. Backwards induction in games of complete and perfect information 399
- 12.4. Nash equilibrium 402
- 12.5. Equilibria in mixed strategies 407
- 12.6. Why might there be an obvious way to play a given game? 410
- 12.7. Refinements of Nash equilibrium 417
 - 12.7.1. Weak dominance 418 • 12.7.2. Subgame perfection (and iterated weak dominance) 421 • 12.7.3. Sequential equilibrium 425 • 12.7.4. Restrictions on out-of-equilibrium beliefs 432 • 12.7.5. Trembling-hand perfection 437 • 12.7.6. Proper equilibria and stable sets of equilibria 442
- 12.8. Reprise: Classic duopoly 443
- 12.9. Bibliographic notes 449
- 12.10. Problems 451

chapter thirteen: Incomplete information and irrationality 463

- 13.1. Games of incomplete information 463
- 13.2. An application: Entry deterrence 468
- 13.3. Modeling irrationality 480
- 13.4. More on refinements: Complete theories 489
- 13.5. Bibliographic notes 496
- 13.6. Problems 498

chapter fourteen: Repeated play: Cooperation and reputation 503

- 14.1. The prisoners' dilemma 503
- 14.2. Repeating games can yield cooperation: The folk theorem 505
- 14.3. Noisy observables 515

- 14.4. Implicit collusion in oligopoly 524
- 14.5. Reputation 531
- 14.6. Reputation redux: Incomplete information 536
- 14.7. Bibliographic notes 543
- 14.8. Problems 546

chapter fifteen: Bilateral bargaining 551

- 15.1. Simultaneous offers and indeterminacy 552
- 15.2. Focal equilibria 554
- 15.3. Rubinstein's model 556
- 15.4. The experimental evidence about alternating offers 565
- 15.5. Models with incomplete information 568
- 15.6. Bibliographic notes 570
- 15.7. Problems 571

part IV: Topics in information economics

chapter sixteen: Moral hazard and incentives 577

- Prologue to part IV 577
- 16.1. Introduction 578
- 16.2. Effort incentives: A simple example 579
- 16.3. Finitely many actions and outcomes 586
- 16.4. Continuous actions: The first-order approach 604
- 16.5. Bibliographic notes and variations 608
- 16.6. Problems 616

chapter seventeen: Adverse selection and market signaling 625

- 17.1. Akerlof's model of lemons 625
- 17.2. Signaling quality 629
- 17.3. Signaling and game theory 645
- 17.4. Bibliographic notes and discussion 650
- 17.5. Problems 654

chapter eighteen: The revelation principle and mechanism design	661
18.1. Optimal contracts designed for a single party	661
18.2. Optimal contracts for interacting parties	680
18.3. The pivot mechanism	704
18.4. The Gibbard-Satterthwaite theorem	712
18.5. Bibliographic notes	713
18.6. Problems	715
<i>part V: Firms and transactions</i>	
chapter nineteen: Theories of the firm	723
19.1. The firm as a profit-maximizing entity	724
19.2. The firm as a maximizing entity	729
19.3. The firm as a behavioral entity	731
19.4. Firms in the category of markets	739
19.5. Bibliographic notes	740
19.6. Problems	740
chapter twenty: Transaction cost economics and the firm	743
20.1. Transaction cost economics and firms	743
20.2. Mathematical models of transaction cost economics	756
20.3. Bibliographic notes	769
postscript	771
appendix one: Constrained optimization	775
A1.1. A recipe for solving problems	775
A1.2. The recipe at work: An example	778
A1.3. Intuition	782
A1.4. Bibliographic notes	788
A1.5. Problems	789

appendix two: Dynamic programming	791
A2.1. An example with a finite horizon	791
A2.2. Finite horizon dynamic programming	796
A2.3. An example with an infinite horizon	801
A2.4. Stationary Markov decision problems	806
A2.5. Bibliographic notes and discussion	813
A2.6. Problems	814
index	817

chapter one

An overview

This opening chapter sets out some basic concepts and philosophy for the rest of the book. In particular, we address four questions: What are the basic categories in microeconomic theory? What are the purposes of microeconomic theory? How does one's purpose influence the levels of scope, detail, and emphasis in one's model? How will the development of the theory proceed in this book?

1.1. *The basic categories: Actors, behavior, institutions, and equilibrium*

Microeconomic theory concerns the behavior of individual economic actors and the aggregation of their actions in different institutional frameworks. This one-sentence description introduces four categories: The individual *actor*, traditionally either a consumer or a firm; the *behavior* of the actor, traditionally utility maximization by consumers and profit maximization by firms; an *institutional framework*, which describes what options the individual actors have and what outcomes they receive as a function of the actions of others, traditionally the price mechanism in an impersonal marketplace; and the mode of analysis for modeling how the various actors' behaviors will aggregate within a given framework, traditionally *equilibrium* analysis.

The actors

In the standard treatment of microeconomics, the two types of actors are the individual *consumer* and the *firm*. We will follow the standard approach by regarding the consumer as an actor. For the firm, we will follow the standard approach for a while by treating the firm as an actor. But firms can also be thought of as institutions within which the behavior of various sorts of constituent consumers (workers, managers, suppliers, customers) are aggregated. From this alternative perspective, what a firm does results from the varying desires and behavior of its constituent consumers, the institutional framework the firm provides, and the equilibrium

that is attained among the constituent consumers within that institutional framework. Much recent work in microeconomics has been directed towards treating the firm in this fashion, and we will take up this approach in the final part of the book.

Behavior

In the standard approach, behavior always takes the form of constrained maximization. The actor chooses from some specified set of options, selecting the option that maximizes some objective function. In orthodox theory, consumers have *preferences* that are represented by a *utility function*, and they choose in a way that maximizes their utility subject to a *budget constraint*. Firms, on the other hand, are modeled as *maximizing profits* subject to the constraints imposed by their *technological production possibilities set*.

These models of consumer and firm behavior typically strike people as fairly obnoxious. We don't find consumers strolling down the aisles of supermarkets consulting a utility function to maximize when making their choices, nor do we typically think of business executives being guided completely and solely (or even mainly) by the effect of their decisions on business profits. Nonetheless, we will use the standard model of consumer behavior throughout, and we will use the standard model of the firm for most of the book. It behooves us, then, to say why we think such models are useful.

Three rationales are often given. First, our models don't presume that consumers actively maximize some tangible utility function; the presumption is that consumers act *as if* this is what they do. Hence an important part of the theory of individual behavior concerns *testable restrictions* of the models we use: What behavior, if observed, would clearly falsify our models? If the models are not falsified by our observations, then our models are good positive models — perhaps not descriptive as to *why* things happen, but good in describing *what* happens.

Unhappily, rather a lot of data has been collected, especially experimentally, which falsifies the models we will employ. At this we fall back to our second line of defense by saying that such violations may be minor and not amount to much. That is, the standard models may be good approximations of individual behavior, and the conclusions of models built from such approximations may thus be approximately valid. This requires a leap of faith, but it is still a leap that has some intuitive appeal. In fact, we can take this a step further: In many (but not all) of our models, the behavior of the individual is unimportant; instead the aggregate behavior of many individuals matters. If we believe that violations of our models

tend to exhibit no particular biases and cancel out at the level of aggregate behavior, then the models may work well. If all we care about are the implications of our models for aggregate behavior, then we will be content to look for testable implications (and falsifications) of our models at the level of aggregate behavior.

The third line of defense is the most subtle. Even if we know that there are systematic violations of our models by individuals, violations that do not cancel out, we can still gain insight into questions of interest by studying models where we assume away those violations. This line of defense is delicate because it requires the theorist to have a deep understanding of which assumptions drive the conclusions that are generated by the theory; we will return to this in the next two sections.

The institutional framework

The actions taken by any individual depend on the opportunities that are presented to the individual. Those opportunities, in turn, often depend upon the collective actions of others. And the consequences for an individual of that individual's actions usually depend on what others have chosen to do. The term *institutional framework* is used throughout to refer to those parts of a model that describe (a) the general nature of options that an individual has, and (b) the options available to and outcomes ensuing for each individual, as a function of other individuals' actions.

In the traditional models of microeconomics, *prices in an impersonal marketplace* constitute the institutional framework; consumers can choose any bundle they can afford, where what is affordable is determined by prices. The market is impersonal in the sense that all consumers face the same array of prices. And the precise choices available to one consumer depend on the consumption choices of all consumers (and the production choices of firms) through these prices.

As we will discuss at length, the workings of the price mechanism are quite fuzzy and ambiguous. Where do prices come from? How are they set, and how do they reflect the actions of individual consumers? Note also the potential of circularity in this; prices constrain the choices of individual consumers, and those choices simultaneously determine prices.

Spurred by these questions, we will look at more concrete and detailed institutional frameworks that are more precise about the connection between the choices of some individuals and the options available to and outcomes resulting for other individuals. An example of a more concrete mechanism, which in some sense leads to the establishment of a "price," is the institution of a sealed bid, first price auction: Anyone who wishes to may submit a bid for an object, with the high bidder winning the

object and paying his or her bid. A different institutional framework for the same purpose is a progressive oral auction — an auction where bids are made openly, and each new bid must beat the previous high bid by some minimal amount.

Predicting the outcome: Equilibrium analysis

Having modeled the behavior of individuals, the nature of the choices they have, and the ways in which their actions affect each other, we are left with the task of saying just what the product of these things will be, that is, predicting what actions will be selected and what results will ensue. We will use various forms of *equilibrium analysis* to address this task. Generally speaking, an equilibrium is a situation in which each individual agent is doing as well as it can for itself, given the array of actions taken by others and given the institutional framework that defines the options of individuals and links their actions.

Although it is not quite how we will conduct business, you might think of this as a feedback system; individuals make individual choices, and the institutional framework aggregates those actions into an aggregate outcome which then determines constraints that individuals face and outcomes they receive. If individuals take a “trial shot” at an action, after the aggregation is accomplished and the feedback is fed back, they may learn that their actions are incompatible or didn’t have quite the consequences they foresaw. This leads individuals to change their individual actions, which changes the feedback, and so on. An equilibrium is a collection of individual choices whereby the feedback process would lead to no subsequent change in behavior.

You might suppose that instead of studying only the equilibria of such a system, we will dive in and look at the dynamics of the feedback, change in behavior, change in feedback, . . . , cycle, that is, the *disequilibrium dynamics* for the institutions we pose. We will do something like this in a few cases. But when we do, we will turn it into a study of *equilibrium dynamics*, where the institutional framework is expanded to include the feedback loops that are entailed and where individuals’ behaviors are dynamically in equilibrium — each individual doing as well as possible given the institutional framework and the dynamic behaviors of others.

Our use of equilibrium analysis raises the question: Why are equilibria germane? Put another way, why do we think that what happens corresponds to an equilibrium? *We make no such blanket assumption.* As we will make especially clear in chapter 12, we rely on intuition and experience to say when this sort of analysis is germane, and while we will sketch a variety of reasons that equilibria might be achieved and

equilibrium analysis might be relevant, we try never to *presume* in a particular application that this is so.

1.2. *The purpose of microeconomic theory*

Having set out the basic categories of microeconomic theory (at least as practiced in this book), we come to the question: What do we intend to get out of the theory? The simple answer is a better understanding of economic activity and outcomes.

Why do we seek a better understanding? One reason that needs no explanation is simple intellectual curiosity. But beyond that, a better understanding of economic activity can be useful in at least two ways. First, as a participant in the economic system, better understanding can lead to better outcomes for oneself. That is why budding business executives (are told to) study microeconomics; a better understanding of the ways in which markets work will allow them to make markets work better for themselves. And second, part of the study of microeconomics concerns the efficiency and specific inefficiencies in various institutional frameworks with a view towards policy. One tries to see whether a particular institution can, by tinkering or by drastic change, be made to yield a socially better outcome; the vague presumption is that changes that improve the social weal might be made via social and political processes. In this book, we will touch on the efficiency of various institutions, although this will be relatively deemphasized.

What constitutes better understanding? Put differently, how does one know when one has learned something from an exercise in microeconomic theory? The standard acid test is that the theory should be (a) testable and (b) tested empirically, either in the real world or in the lab.¹ But many of the models and theories given in this book have not been subjected to a rigorous empirical test, and some of them may never be. Yet, I maintain, models untested rigorously may still lead to better understanding, through a process that combines casual empiricism and intuition.

By casual empiricism joined with intuition I mean that the reader should look at any given model or idea and ask: Based on personal experience and intuition about how things are, does this make sense? Does it help put into perspective things that have been observed? Does it help organize thoughts about a number of "facts?" When and if so, the exercise of theory construction has been useful.

¹ See chapters 3, 6, and 15 if the concept of a laboratory test of an economic theory is new to you.

Imagine that you are trying to explain a particular phenomenon with one of two competing theories. Neither fits the data perfectly, but the first does a somewhat better job according to standard statistical measures. At the same time, the first theory is built on some hypotheses about behavior by individuals that are entirely *ad hoc*, whereas the second is based on a model of behavior that appeals to your intuition about how people act in this sort of situation. I assert that trying to decide which model does a better job of “explaining” is *not* simply a matter of looking at which fits better statistically. The second model should gain credence because of its greater face validity, which brings to bear, in an informal sense, other data.²

Needless to say, one’s intuition is a personal thing. Judging models on the basis of their level of intuitive credibility is a risky business. One can be misled by models, especially when one is the creator of the model, and one is more prone to be misled the more complex the model is. Empirical verification should be more than an ideal to which one pays lip service; one should try honestly to construct (and even test) testable models. But intuition honestly applied is not worthless and should not be completely abandoned. Moreover, exercises can be performed to see what drives the conclusions of a model; examine how robust the results are to changes in specification and precise assumptions.

There is something of a “market test” here: one’s ability to convince others of one’s personal intuitive insights arising from specific models. Microeconomic theorists have a tendency to overresearch “fashionable” topics; insofar as they can be convinced by something because it is fashionable and not because it rings true, they are less than ideal for this market test. But less theoretically and more empirically inclined colleagues (and, sometimes even better, practitioners) are typically good and sceptical judges of the value of a particular model. Attempts to convince them, while sometimes frustrating, are usually helpful both to understand and improve upon a model.

The usefulness of falsified models

To push this even further, I would argue that sometimes a model whose predictions are clearly falsified is still useful. This can happen in at least three ways. First, insofar as one understands how the assumptions led to the falsified conclusions, one understands which assumptions *don’t*

² Readers who know about Bayesian inference should think of this as a case in which the likelihood of the first model is greater, but the second has higher prior probability. Which has a greater posterior probability is then unclear and depends on the relative strengths of the priors and likelihoods.

lead to the “truth.” Knowing what doesn’t work is often a good place to begin to figure out what does.

Second, theory building is a cumulative process. Under the presumption that most economic contexts share some fundamental characteristics, there is value in having models that conform to “generally accepted principles” that have served well in other contexts. Compared with a model that is radically different from standard models, a model that conforms to standard assumptions and principles will be better understood, both by the theory creator and by the audience. Moreover, unification of theory is valuable for its own sake to gain a better understanding of the shared characteristics. Of course, not all contexts are the same, and sometimes what economists think of as “generally acceptable and universally applicable principles” are pushed too far. Economists are well-known among social scientists as imperialists in the sense that economists attempt to reduce everything to economic notions and paradigms. But a real case still can be made for tradition and conservatism in the development of economic (and other) theory.

Granting this, when looking at an economic phenomenon that is poorly understood, economic theorists will attempt to build models that fit into the general rules of the discipline. Such attempts are rarely successful on the first trial. But insofar as first trials do lead to second and third trials, each of which gets one closer, the first trial is of value, and learning about another’s first trial may help you construct the second and third.³

Economists tell a parable about theory and theorists that relates to this. An economic theorist lost his wallet in a field by a road and proceeded to search futilely for the wallet in the road under the illumination of a street light on the grounds that “that is where the light is.” So, the folktale goes, it is with using theoretically “correct” but otherwise inappropriate theory. But an amendment to this tale is suggested by José Scheinkman: Without defending the actions of this particular theorist, perhaps one could try to construct a string of lights that begins in the road and that will eventually reach the field, on the grounds that the road is where electricity presently is found.

Third, and perhaps most subtly, models that fail to predict because they lack certain realistic features can still help clarify the analyst’s thinking about the features they do encompass, as long as the analyst is able to combine intuitively and informally what has been omitted from the model

³ That said, I cannot help but note that the journals contain many more papers that begin “This paper takes a first step in...” than papers that take second or third steps. Not every attempt at widening the scope of economic theory is successful!

with what has been learned from it. Of course, everything else held equal, it is “better” to have a model that captures formally more of the salient aspects of the situation than to have one that omits important features. But all else is rarely equal, and one shouldn’t preclude building intuition with models that make somewhat falsified assumptions or give somewhat falsified conclusions, as long as one can understand and integrate informally what is missing formally.

1.3. Scope, detail, emphasis, and complexity

This leads to a third point about the theories and models that will be encountered in this book: their levels of scope, detail, emphasis, and complexity.

On scope, chapter 8 presents an excellent illustration. Chapter 8 concerns the theory of perfect competition. It begins with the analysis of a market for a single good — the theory of perfect competition that will be familiar to you from intermediate microeconomics. You may recall from intermediate micro that the industry supply curve is the horizontal sum of the individual supply curves of firms, and the supply curves of firms are their marginal cost curves. (If you don’t recall this or never heard of it before, just read on for the flow of what I’m about to say.) This would lead to inaccurate predictions of, say, how price will move with shifts in demand, if one factor of production of the good in question comes from a market that itself has an upward sloping supply curve. To illustrate this, we move in chapter 8 from the traditional model of a single market to consideration of two linked markets, both of which are perfectly competitive. But why stop with two markets? Why not consider all markets together? At the end of chapter 8, under the assumption that all markets are perfectly competitive, we will see what can be said about such a (so-called) general equilibrium.

So what is the appropriate scope for a given model? There is a natural inclination to say that larger scope is better. But there are drawbacks to larger scope. The larger the scope, the more intractable the model, and the harder it is to draw out sharp and/or intuitively comprehensible results. One might feel relatively comfortable making strong assumptions in a model with a narrow scope about how the “outside” affects what is inside the model, assumptions that are (or seem) likely to be true and hence good modeling assumptions but that cannot easily be deduced generally in a model with an expanded scope.

For level of detail, consider how one should treat the family unit in a model of consumer demand. The standard model of consumer demand

envisions a single individual who maximizes his or her utility subject to a budget constraint. Almost anyone who has lived in a family will recognize that family expenditure decisions are a bit more involved than this. Individual members of the family, presumably, have their own tastes. But they recognize a strong interdependence in their personal consumption decisions. (Family members may like, or dislike, taking their vacations in the same location, for example.) And they often pool resources, so that their individual budget constraints get mixed together. Should we treat the family unit as a single consumer or attempt to build a more detailed model about interactions among family members? The answer will depend on what phenomena we are trying to explain. In most models, families are treated “coarsely,” as consuming units, each family conforming to the standard model of the consumer. But for models of the labor supply decisions of families, for example, the detailed modeling of family interaction is sometimes crucial to what is being explained and so is included within the formal model. In general, one pays a cost in tractability and comprehension for increased detail. But in some contexts, greater detail is essential to get at the point in question.

Emphasis is meant to connote something like scope and like detail that isn't quite either. When looking at a particular phenomenon, the analyst may wish to emphasize certain aspects. To do this, the model may become unbalanced — heavy on one aspect of detail, or wide in one aspect of scope, but simple and narrow in all others. Especially when building a model to develop intuition concerning one facet of a larger problem, and where one will rely on less formal methods to integrate in other facets, models that (over)emphasize the facet of immediate interest are warranted.

This discussion is meant to alert the reader to a crucial aspect of microeconomic models and a crucial skill for microeconomists: Building a model is a matter of selecting the appropriate scope, level of detail, and matters to emphasize. There is no set formula to do this, because the appropriate levels of each depend on what the model seeks to accomplish. When “proving” the efficiency of the market system (see chapters 6 and 8), a wide scope is appropriate because overall efficiency is an economy-wide phenomenon. To demonstrate the *possibility* of a particular form of inefficiency in a particular form of market, narrower scope and greater emphasis on a few crucial details are called for. In this book you will see a wide variety of models that vary in their levels of scope, detail, and emphasis, and it is hoped that you will both get a taste for the variety of “types” of models that are used by microeconomic theorists and get a sense of the strengths and weaknesses of those types.

Let me add two further considerations, using the general notion of the level of complexity of one's models. Complexity combines scope and detail, but has other aspects as well, such as the level of mathematics required. Insofar as the model is meant to generate insights and to build intuition, too great a level of complexity in any form is usually bad. Insights and intuition are built from understanding — recognizing (in the model) which assumptions are crucial and what leads to what. The more complex a model is, the harder it is to achieve that sort of understanding. At the same time, simple models too often lead to flawed insights, because the conclusions depend too heavily on the simple setting that is assumed. Lessons that seem obvious from models of single markets in isolation are too easily overturned when one examines the interaction between markets. Balancing these considerations is not easy.

By the same token, building models to explain one's own insights to others requires a balance between complexity and simplicity. Recall that the proposed "market test" was whether you could convince an economist or practitioner who is perhaps not up-to-date with the latest fashion in economic theory but who instead has a well-developed intuitive understanding of how things are. Very complex models that require either a lot of knowledge about the latest techniques or incredible patience to work through mathematical detail will not pass this test. But, at the same time, a lot of the more complex techniques in microeconomic theory are there to check the *consistency* of models; however appealing the conclusions are, a model that is predicated on assumptions that are logically inconsistent or inconsistent with most standard theory is unsatisfactory. The best theories and models are those that pass (possibly complex) tests of consistency or validity and, at the same time, provide insights that are clear and intuitive and don't depend on some mathematical sleight-of-hand. Not all the theories and models that are presented here will pass this dual test. All will pass the consistency test (I hope), so you can anticipate that those that fail will fail on grounds of being too complex to be intuitive.⁴ And those that do fail on grounds of complexity are, by virtue of that failure, somewhat of second (or lower) quality.

1.4. *A précis of the plot*

This book may be thought of as a collection of somewhat interconnected models that are interesting in their own right. But, at the same

⁴ Put an X in the margin by this sentence. When we get to analysis of the centipede game in chapter 14, I will remind you that I gave fair warning.

time, the book has been written to convey the strengths and weaknesses of the tools that microeconomic theory has at its disposal. You should have little problem seeing the individual pieces from the table of contents, but it may be helpful to discuss the more global development that I intend.

First, insofar as one can split the subject of microeconomic theory into (1) actors and their behavior and (2) institutions and equilibrium, this is a book that stresses institutions and equilibrium. I don't mean to disparage the theories of individual behavior that are a cornerstone of microeconomic theory. I've even written a different book on one aspect of that subject. But I believe that *detailed* study of this topic can wait until one studies institutions and equilibrium, and the latter subject is of greater immediate interest and appeal. Still, it is necessary to understand the basics of the standard models of consumer (and firm) behavior before you can understand models of equilibrium, and part I and chapter 7 in part II provide the necessary background. Some readers of this book will have already taken a course that stressed the standard theories of the consumer and the firm. Such readers will probably find a light skim of chapters 2 and 7 adequate, but chapters 3, 4, and 5 present important background for the rest of the book that is treated here in greater depth than is typical in the traditional first course in microeconomics.

Part II takes up the classic "mechanism" by which individuals' diverse desires are meant to be brought into equilibrium: the price mechanism. We progress from situations of perfect competition in which, except for ambiguity about how prices are set, the price mechanism works both clearly and well, to monopoly and oligopoly, where it is less clear that prices alone are doing the equilibrating. By the time we reach the end of oligopoly, we see rather large holes in our understanding of how prices work, and we tentatively attribute those holes to a lack of specification of what precisely is "the price mechanism."

In part III we look at techniques that are meant to help us fill in those holes, techniques from noncooperative game theory. Game theoretic analyses have been extremely fashionable in microeconomic theory since the mid-1970s because such analyses are quite precise concerning institutional framework and because they help us see how institutions matter. Indeed, we will see cases in which, according to the theory, the institutional framework seems to matter too much. But we develop at the same time two weaknesses in such analyses. One, in many important cases, the theory is not determinative — many "equilibria" are possible, and which equilibrium if any arises depends on conjectures that are not provided for by the theory. Two, insofar as institutions matter, one has to wonder where existing institutions come from. Game theoretic analyses take the institutions

as exogenously given. Until we understand where institutions come from and how they evolve, an important part of the puzzle is left unsolved.

Part IV exhibits some of the most important achievements of microeconomic theory in the 1970s and 1980s, developments in the so-called *economics of information*. You are meant to come away from part IV impressed by the insights that can be gleaned by the close analysis of market institutions, both with and without the techniques of noncooperative game theory. To be sure, the problems with our techniques that are discussed throughout part III are not resolved here, and many important questions are left unanswered. But insofar as microeconomic theory has made progress on substantial questions over the past twenty years, this is an area of progress.

In part V we take up the theory of the firm. In standard microeconomic theory firms are actors very much like consumers. We will criticize this classical view and consider instead a view of the firm as something in the category of a market — an institution within which diverse desires of consumers of various sorts are equilibrated. We are able to shed some light on what role firms and other nonmarket institutions play, but we will see that matters crucially important to this subject do not seem amenable to study with the tools at our disposal. In a sense we will come back full circle to individual behavior. The argument will be that we cannot do an adequate job studying firms and other institutions, and especially the origins and evolution of these institutions, unless and until we reformulate and refine the models we have of individual behavior.

All this is, presumably, a bit hard to fathom without a lot of fleshing out. But that's the point of the next eight hundred-odd pages.

index

- Absolute risk aversion, Anscombe and Aumann theory of, 109
- Actor, in microeconomic theory, 3–4
- Actuarial fairness, demand for insurance and, 92
- Actuarial unfairness, demand for insurance and, 92, 97n.j
- Acyclicity of preferences, 22
- “Adding up” constraint, syndicate theory and, 169–74
- Additive across states representation, 102
- Additivity, finite actions and outcomes and, 586
- Adverse selection, 577; Akerlof’s model of lemons, 625–29; human factors in transaction cost economics, 746–47; optimal contract design and, 703; profit-maximizing insurance contracts and, 661–74; signaling quality and, 629–45; worker self-selection from menu of contracts, 638–44
- Agent normal form game, trembling-hand perfection and, 441
- Agents: effort incentives and, 579–80; incentives for interaction, 613; multiple, 610–11; reservation level of utility and, 580; risk averse, 583–85; risk neutral, 582–83
- Aggregate demand, 62–63 consumer choice models and, 4–5; correspondence, defined, 210; existence and Walrasian equilibrium, 207–208, 209–210; fixed point theorem and, 212–13; monopoly and, 299; upper semi-continuity of, 210–211 Walras’ law, 41n.8
- Akerlof’s model of lemons, 625–69
- Algebra, in profit-maximization insurance contracts, 670
- Allais paradox, 116; framing and, 118
- Alternating offer bargaining: bibliographic notes, 570; in bilateral bargaining, 564–65; experimental evidence about, 565–68

- Edgeworth-Bertrand model of equilibrium, 334
- Edgeworth box: bilateral monopoly, 551; finiteness of Walrasian equilibrium and, 214–16; Pareto efficiency and, 155–56; pure exchange and price equilibrium, 188–89; simultaneous offers and indeterminacy, 552–54; social outcomes and, 152–53; Walrasian equilibrium and, 190–92
- Education levels, market signaling and, 630–31
- Efficiency: equilibria in repeated games and, 521–23; externalities and taxes

- and, 288–91; long-run equilibrium and perfect competition, 273–74; in monopolistic competition, 345; social choice and, 149; trigger equilibria and, 519–20; welfare theorems and general equilibrium economy, 287–88
- Effort: case of two outcomes and, 601–602; first-best level of, 590–91; incentives, defined, 579–80
- Elasticity of demand: Bertrand equilibrium and, 335; cost functions and, 255–56; in monopolies, 300; supply runs and, 278–79
- Ellsberg paradox, 116–17
- Empirical evidence, impact on choice models in simple settings, 115–18
- Endowments: externalities, taxes and efficiency, 290; risk of, in profit-maximizing insurance contracts and adverse selection, 662; pure exchange and price equilibrium, 188
- Engle curves defined, 49–50
- Entry deterrence: bibliographic notes, 496–97; entrant's beliefs and, 476; games of incomplete information and, 468–80, 537; limits of game theory and, 529n.2; market signaling and, 651–52; oligopolies and, 341–42; possibility or coherence of, 478n.3; reputation and, 535–37; role in maintaining monopolies, 303–304; screening equilibrium and, 480
- Envelope theorem: firm's cost maximization problem (FCMP), 252; Hicksian demand function, 56
- Equilibrium: Bertrand, 330–35; bibliographic notes, 449; bilateral bargaining and, 553n.a; chess and, 772–73; consistency of conjectures in, 329–30; cooperation as, 506–507; Cournot conjectures and, 326–28; divine or universally divine, 437; dynamics of, in perfect competition, 6, 277–78; equal prices, 332–33; firm as behavioral entity and, 733–39; focal points and principles in games and, 415–16; folk theorems and, 771; implicit collusion and noise and, 526–29; limits of game theory and, 529–31; long-run, in perfectly competitive market, 272–73; mechanism design and revelation principle, 691–97; microeconomic theory and, 3, 6–7; mixed strategies in noncooperative game theory, 407–10; in monopolistic competition, 343–46; noncooperative game theory and, 355–56, 405–406; in perfectly competitive market, 265–66, 268–69; pooling, 477–78; proper and stable sets of, 442–43; repeated games, bibliographic notes on, 544; reputational, 533–35; Rubinstein's model bilateral bargaining, 560–61; screening, 478–80; sequential, as Nash equilibria refinement, 426–32; sophistication and efficiency, in repeated games, 521–23; Spence's job market signaling model, 632–38; too many outcomes in repeated games, 507–512; transaction cost economics and, 724; unequal prices, 332; Van Stackelberg, 328–29. *See also* specific equilibria, e.g. Nash equilibrium
- Equilibrium-dominated tests, 436

- Equity, efficiency and, 149
- Equivalence: Kuhn's theorem and, 383–84; preference and, 23n.a
- Ex ante costs: and quality of transactions, 748–49; as transaction costs, 743–44
- Ex ante incentives, transaction cost economics, 767–68
- Ex ante interim, direct revaluation mechanism and, 691
- Excess capacity, in monopolistic competition, 345
- Exchange, transaction cost analysis and, 761–62
- Exercise, and noncooperative game theory, 389–93
- Existence, Walrasian equilibrium and, 206–213, 291–92
- Exit barriers, oligopolies and, 341–42
- Expected/discounted value, folk theorem and, 506
- Expenditure function: conditional factor demands and cost functions, 250–51; dual consumer problem and, 46–48; Hicksian demand and, 54–56
- Ex post costs: and quality of transactions, 748–49; as transaction costs, 743–44
- Ex post implementation, direct revaluation mechanism and, 691, 699n.h
- Ex post incentives in transaction cost economics, 767–68
- Extending monopoly, 305
- Extensive form games: available actions set, 367; backwards induction and, 399–400; bibliographic notes, 380–84; Cournot subgame given entrant's beliefs, 475–76; decision node assignments for players, 367; decision trees and, 357–60; examples of, 356–63; finite set of players, 363; form of, 371n.2; formalities in, 363–76; games of incomplete information and, 464–65, 492–93; game trees in, 361–64, 367–71; of incomplete information, 488–89; infinite players and/or actions, 375; information sets in, 367–69; mixed strategies and Kuhn's theorem, 380–84; monopoly model of incomplete information, 472–73; normal form counterparts for, 379–80; out-of-equilibrium beliefs and, 432–33; payoff assignments, 369–70; perfect re-call, 373–75; player assignments at decision nodes, 367; precedence in, 363–66, 372–73; predecessors in, 363–65; probability distribution, 370–71; representation, 360–63, 377–78; reputation and transaction cost economics, 764–67; rigid well-specified rules for, 376–76; sequential equilibrium refinement, 426–27; sequential rationality and, 429–30; set of available actions, 367; simultaneous moves in, 371–72; Spence's job market signaling model, 645–49; strange order of moves for, 372–73; structure of, 355–56; successors in, 366–67; theory for, 380n.e; trembling-hand perfection and, 439–41; truth game as, 433–34; worker self-selection and menu of contracts model, 649
- Externalities: general equilibrium with firms and, 288–91; public goods and, 168n.j; Walrasian equilibrium, 202–205
- "Fair certainty" concept, dominance in normal form games and, 396

- Falsified models, usefulness of, 8–10
- Family unit, role of, in consumer demand, 10–11
- Feasible allocations, 151; and Edgeworth box, 153
- Feasible set, constrained optimization and, 784–86
- Feasible social outcomes: defined, 150; Pareto efficiency and, 154
- Feasible utility imputations, 150–51
- “Fictitious play” models, 413–14
- Final consumption allocation, defined, 190
- Financial assets, demand for and uncertainty, 93–98
- Finite actions and outcomes, incentives and, 586–604; Walrasian equilibrium and, 214–16
- Finite but indefinite horizon, equilibrium outcomes in repeated games, 507–512
- Finite horizon models: alternating offer bargaining, 566n.2; bibliographic notes on, 544; dynamic programming, 138–39, 791–96; in repeated games, 513–15
- Finite strategy games, mixed strategies and Nash equilibrium, 409–410
- Firms: as actors, in economic theory, 3–4; as behavioral entities, 731–39; bibliographic notes on, 259, 292–93; economy and general equilibrium of, 284; existence and local uniqueness of, 291–92; externalities, taxes and efficiency, 288–91; general equilibrium theory and, 187, 283–92, 746–47; long-lived and short-lived, and reputational equilibria, 534–36; managerial models of, 723; in market category, 739; as maximizing entity, 729–30; in neoclassical economic theory, 233–55; as profit-maximizing entity, 724–29; reputation and, 764–67; supply function of, 267; theories of, 14, 723–40; transaction cost economics and, 743–69; Walrasian equilibrium, 285–86; welfare theorems, 286–88; worker-managed, 730
- Firm’s cost maximization problem (FCMP), 250–53; conditional factor demands and cost functions, 250–53; properties of solutions of, 251–52; Shepard’s lemma, 252–53
- “First best” contract, moral hazards and incentives, 585
- First-order conditions (FOCs), 780–82; constraints on, 786–88; for consumer problems (CP), 51–53; moral hazards and incentives, 605–608; unconstrained optimization and, 783–84
- “First-order” equations, and continuous actions, 608
- Fixed and finite horizon, reputation and, 533
- Fixed costs: as long- and short-run costs, 256–57; reputational equilibria and, 535–36
- Fixed incentives, continuous actions and, 607–608
- Fixed point techniques: economies with firms, 291–92; Walrasian equilibrium and, 211–13
- Flexibility, about future consumer preferences, 142–43
- Focal equilibria, bilateral bargaining and, 554–56
- Focal point: defined, 415; repeated games and, 512–13; reputation and, 533
- Focal principle, defined, 415
- Folk theorem: bibliographic notes on, 543; bimatrix games, 509–510;

- cooperation with repeating games and, 505–515; implicit collusion in oligopoly and, 525; lack of focal point and, 512–13; limits of game theory and, 530; maximax value and, 508–509; noisy observables in repeated games, 516–17; profit maximization and, 727; relational contracting and, 771; reputational equilibrium, 534
- “Forgetful” player, extensive form games and, 373–75
- Forgiveness: inefficiencies in unified governance, 756n.12; noisy observables in repeated games, 516; in repeated games, 523
- Formalism, perfect recall and, 374–75
- Forward contracting, optimal dynamic strategy for choice, 134
- Framing: Allais paradox, 116n.7; choice theory and, 117–18; consumer choice, 64; Houthakker’s axiom of revealed preference, 28
- Franchise fees, monopoly selling to monopolies example of nonlinear pricing, 311–14
- Free disposal: production functions, 238; production possibility set, 235
- Free-rider problem, firms and reputation, 767
- Frequency, and quality of transactions, 747–49
- Full information equilibrium, wages-education utility functions, 631–32
- Full insurance, consumer constraints and, 672–73
- Gambles, and utility theory, 72–73
- Game of complete and perfect information, 399–402
- Game of incomplete information: closure of model, 467; concepts and structure of, 436–68; Cournot subgame given entrant’s beliefs, 474–76; entry decision given entrant’s beliefs, 476; entry deterrence application, 468–80; irrationality modeling, 480–89; models for, 464–67; Nash equilibrium refinements, 489–97; nonequilibrium, 476–77; pooling equilibrium, 477–78; prior distribution on initial states, 467; screening equilibrium, 478–80
- Game theory: anticipatory equilibrium and, 649–50; bibliographic notes on, 384; cooperative and noncooperative, 355–56; direct revelation mechanism, 687–91; limits of, 529–31; market signaling and, 651–52; mechanism design and revelation principle, 691–97; moral hazards and incentives, 603–604; reactive equilibrium and, 649–50; role of, in microeconomic theory, 13; signaling and, 645–50; Spence’s job market signaling model, 645–49; weakness of, 771–72; worker self-selection model and menu of contracts, 649. *See also* Extensive form games; Noncooperative games
- Game tree: alternating offer bargaining, 566n.2; decision trees and, 361–62; game of complete and perfect information, 400–402; mechanism design and revelation principle, 691n.e; Rosenthal’s centipede game, 401–402; structure of, in extensive form games, 363–66
- Game with imperfect information, 468
- General equilibrium: Arrow-Debreu contingent claims markets, 217–20; bib-

- liographic notes, 223–24, 292–93;
competitive firm and perfect competition, 263–64; defined, 187; economy, with firms, 283–92; firm externalities, taxes and efficiency, 288–91; firm's existence and local uniqueness, 291–92; human factors in transaction cost economics, 746; profit maximization and firm theory, 728–29; securities and spot markets, 220–23; temporary, 216–23; welfare theorems, 286–88. *See also* Walrasian equilibrium
- Generalized Axiom of Revealed Preference (GARP): aggregate demand and, 63; Marshallian demand and, 42–45
- General mechanism, defined, 691–92
- Gibbard-Satterthwait theorem, 712–13
- Giffen good: and comparative statics, 61; defined, 49
- Golden parachutes, profit maximization and, 725–26
- Governance: human factors in, 744–47; inefficiencies in, 755–56; labor exchange relationship and, 762–63; matching transactions to, 751–53; transaction cost economics and, 749–51; unified structure, 751
- Government regulation: direct revaluation mechanism and, 686–91; profit-maximizing insurance and adverse selection, 675; toy problem and, 681–84
- Green mail, profit maximization and, 725–26
- Gresham's law, 625
- Grossman and Hart analysis of incomplete contracts and ownership, 758–59
- Gross profit, 595–96; moral hazard and incentives and, 594–95
- Gross return, risk aversion and, 86

- Menu of contracts: game theory and, 650; for noninteracting parties, with nonlinear prices, 679–80; worker self-selection model, 638–43
- Microeconomic theory: actors in, 3–4; behavior in, 4–5; equilibrium analysis, 6–7; institutional framework for, 5–6; organization and structure of, 12–14;

- purpose of, 7–10;
scope and complexity of models, 10–12
- Milgrom and Roberts bargaining cost analysis, 759–61
- Minimax value, folk theorem and, 508–509
- Mixed strategies: equilibria in, 407–10; extensive game theory and, 380–84; Nash equilibrium and noncooperative game theory, 406; reputation and incomplete information, 541; worker self-selection model and menu of contracts, 649n.g
- Mixing probabilities, modeling irrationality and, 486–87
- Mixture Space Theorem, 106n.m
- Mobility barriers, oligopolies and, 342
- Models of consumer choice: falsified models, 8–10; scope and complexity of, 10–12; testable restrictions of, 4
- Money, utility theory for, 81–86
- Monitoring: of effort incentives, 581–82; implicit collusion and noise and, 526–29; incentives and, 579; limits of game theory and, 529–31; transactional cost economics and, 762n.16
- Monopoly: bargaining power of, 771; bibliographic notes on, 317–18; bilateral, 314n.5, 551; Coase conjecture, 315–17; durable goods, 315–17; entry deterrence and games of incomplete information, 468–80; equilibrium in, 343–46; extending, 305; maintenance of, 302–304; multigood, 304–305; nonlinear pricing for, 306–314; optimal scale of, 301; partial equilibrium analysis and, 281n.6; power of, 314–17; research and development in, 343; selling to monopolies example, 309–14; standard theory of, 299–302
- Monopsomy, defined, 551
- Monotonicity: Marshallian demand and, 40n.l; of preferences, 33–34; wage-education utility function, 630–31
- Monotonic-likelihood ratio property, 595–96
- Monte Carlo simulator, search routines and, 735–36
- Moral hazard: adverse selection and, 629, 675; basic concepts and, 577–79; bibliographic notes on, 608–14; contextual applications, 613–14; continuous actions — a first-order approach, 604–608; defined, 577; effort incentives and, 579–85; finitely many actions and outcomes, 586–604; human factors in transaction cost economics, 746–47; interaction incentives, 613; multiperiod incentives, 611–12; multiple agents and principles, 610–11; optimal contract design and, 703
- More-than-two-player games, dominance in, 397n.b
- “Most favored customer” guarantees, in monopolies, 316–17
- Multigood monopoly, 304–305
- Multiperiod incentives, 611–13
- Multiple equilibria: bargaining and, 772; revelation principle and mechanism design, 697–700
- Multipliers in constrained optimization, 776–78, 782
- Multiproduct firms, cost functions in, 255n.i
- Myerson’s properness criterion, 442–43; Nash equilibrium refinements and, 489–97

- Nash bargaining solution, 180–81
- Nash equilibrium: bibliographic notes on, 449–50, 497; bilateral bargaining and, 554; centipede game and, 541–42; Cournot, Bertrand and von Stackelberg equilibria and, 445; with definite finite horizon, 514–15; direct revelation mechanism, 686–91; dominant strategy implementation and revelation mechanisms, 697–700; finite strategy games and, 409–410; focal points and principles, 414–16; games of incomplete information and, 470–71, 489–96; implicit collusion in oligopoly and, 525; learned behavior and, 413–14; mixed strategies in noncooperative games, 407–410; modeling irrationality and, 484–86; moral hazards and incentives, 603–604; noncooperative game theory and, 355–56, 402–406, 417–43; nonstories in, 416–17; out-of-equilibrium belief restrictions, 432–37; proper and stable equilibria sets, 442–43; reactive equilibrium and, 650; refinements of, in noncooperative game theory, 417–43; in repeated games, 506; reputation and incomplete information, 537; revelation principle and mechanism design, 692n.f, 693–97; sequential equilibrium, 425–32; signaling games and, 435–36; Spence's job market signaling model and, 646–49; subgame perfection (iterated weak dominance), 421–25; too many outcomes in repeated games, 507–512; toy problem and, 682–84, 701–703; trembling-hand perfection, 437–41; weak dominance refinement, 418–21; worker self-selection model and menu of contracts, 649
- Nash social choice rules, 180–81
- Nature nodes: in extensive form game trees, 360–64; precedence of, 362–63; Savage theory and, 99–100; uncertainty and, 98–111
- Necessary conditions, Nash equilibrium and noncooperative game theory, 404–405
- Necessary good: comparative statics, 61; defined, 50
- Negatively transitive strict preference, utility functions of, 30–32
- Negative semi-definite Hessian matrix, 60
- Negative transitivity: of preferences, 21–22; social choice rule and, 176; social outcomes and, 157–58; uncertain future tastes and, 142–43; weak preference and indifference, 23–24
- Negotiation, bilateral bargaining and, 552–53
- Nelson and Winter behavioral models, 738–39
- Neoclassical contracting, 750–51
- Neoclassical theory, firms in: bibliographic notes, 740; as behavioral entity, 736–39; competitive firms and profits, 239–40, 242–47; cost functions and -runs, 255–58; input requirements and iso-quants, 236–38; intermediate micro analysis, 240–42; production functions, 238–39; production possibility set, 234–36; from profit and cost functions to technology sets, 253–55; profit function, 239–50; technological capability models, 234–39; testable restrictions for, 247–50

- Nesting property, input requirement sets, 238
- Netput vectors, production possibility set, 234–36
- Net trade, 195
- “Next-to-final” node, game of complete and perfect information, 400–402
- Nice direct revelation mechanism, 688–91, 697–700
- Nodes, in extensive form game trees, 363
- No-entry theories, oligopolies and, 342
- Noise: implicit collusion and, 526–29; reputational equilibria and market price, 535–36
- Noisy observables: implicit collusion and, 527–29; in repeated play, 515–23; reputation and, 533
- Noncomparability of preferences, 23–24
- Noncooperative game theory: background on solution concepts, 387–88; backwards induction — game of complete and imperfect information, 399–402; bibliographic notes on, 449–50; bilateral monopoly and, 551; concepts of, 355–56; divide the cities game, 392–93; divide the letters game, 393; dominance and iterated dominance in normal form games, 393–99; duopoly models and, 339–40, 443–49; exercise, 389–93; folk theorem and, 506n.c; ground rules and cheap talk, 388–89; iterated weak dominance, 393–99, 421–25; mixed strategy equilibria, 407–10; Nash equilibrium and, 402–406, 417–43; noisy observables in repeated games, 516; obvious solutions to, 410–17; out-of-equilibrium belief restrictions, 432–37; prisoner’s dilemma game and, 503–504; proper and stable sets of equilibria, 442–43; sequential equilibrium, 425–32; subgame perfection, 421–25; subject population, 387–88; trembling-hand perfection, 437–41; trigger equilibria and, 517–21; weak dominance, 418–21
- Nondecreasing preferences, Walrasian equilibrium and, 191n.a
- Nondecreasing returns to scale, 236, 238
- Nondecreasing risk aversion, 85
- Nondecreasing utility functions, 33
- Nonemptiness, revealed preference and, 27–28
- Nonequilibrium: game of incomplete information and, 476–77; Rothschild and Stiglitz model, 644; Spence’s job market signaling model, 635–36; worker self-selection and menu of contracts model, 643
- Nonincreasing returns to scale: production functions, 238; production possibility set, 235–36
- Nonincreasing risk aversion, 85
- Noninteracting parties, contract design for, 679–80
- Nonlinear prices: optimal contract design for noninteracting parties, 679–80; perfect competition and, 265; monopolies and, 306–314
- Nonnegative numbers, 31n.3
- Nonnegativity: constrained optimization and, 786–88; decision variables with dynamic choice, 137n.b; direct revelation mechanism, 685–86, 687–88; dynamic choice and, 138–39; expected utility of wages, 588–89; of linear demand, 275n.5; local insatiability and Marshallian demand,

- 41n.m; marginal rates of substitution, 167n.i; of multipliers, in constrained optimization, 779; optimal dynamic strategy for choice, 134–36; Walrasian equilibrium of firms, 285–86
- Nonstories, Nash equilibrium and, 416–17
- Normal cumulants, sophisticated and efficient equilibria in repeated games and, 522–23
- Normal distribution, noisy observables and, 515–16
- Normal form games: backwards induction and, 399–400; bibliographic notes on, 384; dominance and iterated dominance in, 393–99; dominance solvability in, 394–96; form for, 379; mixed strategies and Kuhn's theorem, 380–84; Nash equilibrium and, 402–406; structure of, 355–56, 376–80; trembling-hand perfection and, 439–41
- Normal good, comparative statics and, 61; defined, 49
- Normal random variables, trigger equilibria and, 517–21
- Numerical representation: benevolent social dictator model, 158–59; of consumer preference, 30–32; continuous, 36; von-Neumann-Morgenstern expected utility, 76–77
- Objective probability distribution, 73; utility theory and, 71
- Objective reality, in extensive form game trees, 369n.d
- Objective uncertainty, Ellsberg paradox, 117 “Obvious-way-to-play” strategy: convention, 412–13; focal points and principles, 414–16; learned behavior, 413–14; Nash equilibrium and, 403–405, 410–17; and noncooperative game theory, 403–405; in nonstory, 416–17; preplay negotiation, 411–12
- Oil tanker shipping industry: in perfectly competitive market, 265n.1; supply runs and, 272n.b
- Oligopolies: differentiated commodities, 342–43; duopoly and, 341; implicit collusion in, 524–31; local, 345–46; nonlinear pricing and, 306
- “One-stage lottery,” complementary probability of, 79–80
- One-to-one function, in extensive form game trees, 367
- Onto function, in extensive form game trees, 367
- Opportunistic behavior: mathematical models of, 757; transaction cost analysis, 744–47, 761–64
- Opportunity set: and behavioral theories of firm, 734–39; dynamic choice and, 139
- Optimal contracts: bibliographic notes on, 713–14; credibility and, 677–79; design for noninteracting parties, 679–80; direct revelation mechanisms for, 684–91, 700–703; high-risk vs. low-risk consumers, 665–67; incentives and, 577; interacting parties, 680–703; multiple equilibria and dominant strategy, 697–700; profit-maximizing insurance contracts, 661–74; revelation principle and, 691–97; single party design, 661–80; toy problem, 681–84; variations, extensions and complications, 674–77
- Optimal decisions, contingent, with dynamic programming, 792–96
- Optimal direct revelation mechanisms,

- 684–91
- Optimal dynamic strategy: defined, 133; and dynamic choice, 133–39
- Optimal scale of monopoly, 301
- Optimal search models, 578
- Optimal stopping problem, 796–801
- Optimal strategies, 785–86; dynamic programming and, 809–810; social outcomes and, 153–56; trembling-hand perfection and, 439–40
- Optimal value: dynamic programming and, 809–810; monopoly example of nonlinear pricing, 310–11
- Optimization theory: constrained, 775–89; continuous actions and, 607–608; finite horizon dynamic programming, 799; multiperiod incentives, 611–13; noisy implicit collusion and, 528
- Organizational design, and multiperiod incentives, 613
- Outcome, mechanism design and, 701–702
- Out-of-equilibrium concept: game of incomplete information and, 489–97; Nash equilibria weak dominance refinement and, 419–21; pooling equilibrium and, 478n.3; repeated games and, 513; restrictions on, 432–37; Spence’s job market signaling model and, 646–49; subgame perfection Nash equilibria refinement, 422–25
- Outside options, Rubinstein’s model of bilateral bargaining, 562
- Overinsurance: moral hazard and adverse selection, 676n.3; profit-maximization insurance contracts and adverse selection, 671–72
- Own price effects, defined, 49
- Pareto efficiency: Arrow’s possibility theorem and, 175, 177–81; concavity and, 161–62, 200–202; Edgeworth box and, 155–56; endowment and, 199–200; general equilibrium and, 286–87; incomplete information bilateral bargaining, 568–70; nonnegative weights and, 161; pure exchange and price equilibrium, 188–89; Rubinstein’s model of bilateral bargaining, 561; separating hyperplane theorem, 162–64; social outcomes and, 153–56; social welfare functionals, 160–62; syndicate theory and, 170–74; transaction cost economics and, 755n.11; utility imputations, 154; Walrasian equilibrium and, 199–202; welfare theorems and, 286–87
- Pareto frontier: defined, 154; Edgeworth box and, 156; Rubinstein’s model of bilateral bargaining, 561; utility imputations, 154–55
- Pareto incomparability, 153–54
- Pareto inferiority, 153–54
- Pareto optimal outcome, pivot mechanism and, 712
- Pareto superiority: benevolent social dictator model, 158; convexity of social outcomes and, 158n.c; externalities of Walrasian equilibrium, 204–205; social outcomes and, 153–54
- Partial equilibrium analysis: bibliographic notes, 292–93; competitive firm and perfect competition, 263–64; game theory and, 530; limits of, 279–83; power of, 278–79
- “Partial solutions,” game of incomplete information refinements and, 495–96
- Participation con-

- strait, 589; high-risk consumer and (PH), 668–74; low-risk consumer and (PL), 668–74; multipliers on, 591–92; optimal solutions and, 591–92; of risk averse agents, 585
- Partition of S set, general equilibrium theory and, 217–20
- Path dependency, dominance in normal form games and, 395n.a
- Payoff assignments: in extensive form game trees, 369–70; folklore theorem, 508–509
- Payoffs: noisy observables and, 515–16; trigger equilibria and, 519–20; vectors, extensive form game representation and, 360–63
- Perfect Bayes equilibrium, defined, 431–32
- Perfect competition: demand curves and, 266–67; long run, 271–79; market conditions for, 264–67; runs and, 267–79; short and intermediate runs, 267–71; theory of, 10
- Perfection, failure of, 443
- Perfect recall, extensive form games and, 373–75
- Pivot mechanism, 704–12
- Planning, welfare theorems for general equilibrium economy, 286–87
- Players, in extensive form games, 363
- Poison-pill provisions, profit maximization and, 725–26
- Poker games, focal equilibria in bilateral bargaining and, 555–56
- Pooling equilibrium: destruction of, in menu of contracts, 640–41; game of incomplete information and, 477–78; job market signaling model, 633–38, 648–49
- Portfolio effects, consumer choice models and, 112–13
- “Positive economics” defense, choice models and, 119
- Positive social responsiveness, 174–75
- Precedence: in extensive form game trees, 363; information sets and, 372–73; perfect recall and, 375
- Predecessors, in extensive form game trees, 364–66
- Preference maximization: aggregate demand and, 63; consumer choice and demand, 44–45
- Preferences: Anscombe and Aumann theory, 105–110; Arrow’s possibility theorem and, 175; asymmetric, 19–21; axioms for, 74–76; basic relation of, 19–22; as behavior, in microeconomic theory, 4–5; from choice to, 26–30; to choice from, 24–26; continuity with benevolent social dictator model, 158n.b; dynamic choice and, 139–40; GARP and, 41–45; incomparability of, 23; interpersonal comparisons of intensity, 180–81; Marshallian demand and, 39–40; monotonicity and local insatiability of, 33–34; negatively transitive, 21–22; optimal dynamic strategy for choice, 133–36; properties for consumption bundles, 32–37; representation of, 76–81; social outcomes and, 157–58; theory of, 18–37. *See also* Strict preference; Weak preference; Indifference
- Preplay negotiation: Nash equilibria weak dominance refinement and, 419n.18; “obvious way to play” strategy, 411–12
- Prestige, as maximization incentive, 730
- Prices: in Cournot equilibrium, 328; dual consumer

- problem and, 47–48; duopoly models and, 448–49; equilibrium mechanisms, 187–92, 195–98, 332–33; externalities, taxes and efficiency, 290–91; implicit collusion and noise and, 526–29; induced preferences for income, 90–91; as institutional framework for economic theory, 5–6; intermediate-run equilibrium and perfect competition, 277–79; “invisible hand” of, 200; long-run equilibrium and perfect competition, 276–79; market transactions and, 187; in monopolies, 303–304, 306–10, 315, 316n.6; non-linear, monopolies and, 306–314; profit functions and, 239–40; profit maximization and theory of firms, 727; role of, in microeconomic theory, 13; vector of, 189; Walrasian equilibrium and, 193–98, 206–13
- Principal: effort incentives and, 579–80; multiple, 610–11
- Principle of optimality, 798–801
- Prisoner’s dilemma game: folk theorem and, 505–515; repeated play in, 503–504
- Private goods, social provision of, 165–67
- Prizes (outcomes), utility theory and, 72–73
- Probability: in decision trees, 359n.a; dynamic choice and, 137n.1; incomplete information bilateral bargaining and, 568n.4; mixed strategies in non-cooperative games and, 408; modeling irrationality and, 482–89; Nash equilibria weak dominance refinement and, 419–21; noisy observables and, 515n.g; subjective, 98–111
- Probability distribution: Anscombe and Aumann theory, 105–110; defined, 72–74; in extensive form game trees, 370–71; induced preferences for income, 87–91; limits of normal support, 73, 79–80; randomization in extensive form games, 382–83; simple, 72–74; states of nature and, 102n.k; Spence’s job market signaling model, 633n.a; temporal resolution of uncertainty and, 113–15
- Production: changes in firm’s routine, 734–35; duopoly models and, 447–48; firm as behavioral entity and, 731–39; neoclassical firm models, 238–39; short-run and long-run routines, 734–35; technology, maintaining monopolies with, 302–304; theories of the firm and, 723; Walrasian equilibrium and, 194
- Production possibility set in neoclassical firm models, 234–36
- Product variety, multi-good monopolies and, 304–305
- Profit function: competitive firms and, 239–40, 242–47; derivative property (Hotelling’s Lemma), 245–47; iso-profit curves, 240–41; marginal revenue product, 242; neoclassical firm models, 239–50; properties of, 244–47; technology sets and, 253–55; testable restrictions, 247–50; value of marginal profit, 241–42
- Profit maximization: behavioral theories of firm and, 4, 734–39; bibliographic notes, 740; firm theory and, 240–47, 724–29; graphical analysis of, 672–74; incentive constraints and, 589; insurance contracts with

- adverse selection, 661–74; syndicate theory and Pareto efficiency, 171n.1
- Proper equilibria: non-cooperative game theory and, 442–43
- Properness concept, 442–43
- Proper subgame, defined, 423. *See also* Subgame perfection
- Public goods, social provision of, 168–69
- Punishment: implicit collusion and noise and, 527–29; noisy observables in repeated games, 516; in repeated games, 509–510, 521–23; trigger equilibria, 517–21
- Pure exchange: defined, 187; price equilibrium and, 187–92
- Pure strategies: in extensive form games, 381; in noncooperative games, 408
- Purification theorems, finite strategy games and, 410
- Quality, in Akerlof's market for lemons model, 627; reputation and, 531–36; of transactions, 747–49
- Quantity: Bertrand equilibrium and, 333–35; correctness of duopoly models and, 339–40; in Cournot equilibrium, 327–28; duopoly models and, 447; role in maintaining monopolies, 303–304
- Quasi-concave functions: first-order conditions for, 52; preference and, 35–36
- Quasi-convex function: indirect utility function, 46; preference and, 35; social provision of private goods, 166–67
- Randomization: extensive form games, 382–83; mechanism design and revelation principle, 691n.d; mixed strategies in non-cooperative games and, 408–409; reputation and incomplete information, 541
- "Randomly selected" exchange economy, finiteness of Walrasian equilibrium and, 214–16
- "Random meetings" marketplace, Walrasian equilibrium and, 197–98
- Random variables, 73n.a
- Ratchet effect: ex ante and ex post incentives, in transaction cost economics, 768; multiperiod incentives, 612–13
- Rationality: backwards induction and, 402; bargaining costs and, 760–61; dominance in normal form games and, 395–96; dominance solvability and, 398–99; as human factor in transaction cost economics, 745–47; iterated dominance in normal form games, 396–97; Nash equilibrium and noncooperative game theory, 402–403; noncooperative games populations, 387–88; sequential, 427–32
- Rationing supply, perfect competition and, 266n.a
- Ratio of marginal utilities and prices, 52–53
- Rawlsian social welfare functional, 160
- Reaction function: Bertrand equilibrium, 331–32; Cournot equilibrium, 326–28; in kinked demand, 336–37
- Reactive equilibrium: game theory and, 649–50; model for market signaling, 644–45
- Real estate transactions, as classical contracting, 750n.6, 752
- Recursive equation: dynamic programming and, 808; optimal value function, 810
- Reduced form solution

- concept, Walrasian equilibrium as, 195
- Reduced lottery, defined, 74–75
- Reflexivity, weak preference and indifference, 23–24, 24n.b
- Rejection of offers, Rubinstein's model of bilateral bargaining, 562–63
- Relational contracting, 752–53
- Relative bargaining abilities, bilateral bargaining and, 553–54
- Relative costs, transaction cost economics and governance, 755–56
- Relative incentive constraints, 589; analysis of, 590–91; monotone-likelihood ratio property, 596; strictly positive multiplier, 595; wages and, 592–93
- Relative performance evaluation, literature on, 610–11
- Repeated play: in auditing procedures, 763; bibliographic notes on, 543–44; with definite finite horizon, 513–15; folk theorem and cooperation, 505–515; forgiveness in, 523; implicit collusion in, 524–31; incomplete information and, 536–43; lack of focal point and, 512–13; market signaling and, 652; noisy observables, 515–23, 526–29; oligopoly and, 524–31; out-of-equilibrium threats, 513; prisoner's dilemma, 503–504; reputation and, 531–36; revelation principle and mechanism design, 696–97; sophisticated and efficient equilibria and, 521–23; too many equilibrium outcomes in, 507–512; transaction cost analysis, 761–64; trigger equilibria and, 517–21
- Representation:
 - Anscombe and Aumann theory, 103–110; in extensive form games, 360–63; of preferences, 76–81; Savage's sure thing principle, 103–104; Savage theory of choice and, 100–102
- Reputation: adverse selection and, 629n.1; bibliographic notes, 769; equilibria in, 533; firms and, 764–67; incomplete information and, 536–43; repeated games and, 531–36; transactional cost economics and, 762
- Resale of goods and services: Bertrand equilibrium and, 333–35; perfect competition and, 265
- Research and development, in oligopolies, 343
- Reservation level of utility, in agent, 580
- Response speeds, Rubinstein's model of bilateral bargaining, 562
- Retailing industries:
 - demand in, 310–11; monopolistic competition in, 345
- Revealed preference:
 - from demand data, 42–43; dynamic choice and, 140–41; Houthakker's axiom of, 27–30. *See also* Generalized Axiom of Revealed Preference (GARP)
- Revelation mechanisms, optimal direct, 684–91
- Revelation principle:
 - dominant strategy mechanisms and, 700; Gibbard-Satterthwaite theorem, 712–13; implementation and, 703; incentives and, 577; mechanism design and, 661–713
- Revenues: elasticity of, in monopolies, 300
- Rigid rules, extensive form game trees and, 375–76
- Riley and Wilson game theory, 649–50, 644–45
- Risk aversion: absolute and relative, 84–87; agent for, 583–85, 590–93; at-

- least and at-most-as-risk averse consumers, 86; demand for financial assets and, 95–96; in finite actions and outcomes, 586–87; incomplete information bilateral bargaining, 568n.4; optimal insurance contracts for non-interacting parties, 679n.5; profit-maximizing insurance contracts and adverse selection, 662; syndicate theory and, 172–74; utility theory and, 82–83
- “Riskier than” concept, risk aversion and, 83
- Riskless assets, demand for, 93
- Risk neutrality: agent for, 582–83; consumer, defined, 82; direct revelation mechanism, 688–89; effort incentives and, 582; financial assets and, 94–95; in finite actions and outcomes, 587; insurance and, 92n.2; participation constraint and, 591n.4; specialization of, 593–95; syndicate theory and, 172–74
- Risk premium, defined, 84–85
- Risk-seeking consumer, defined, 82
- Risky assets: demand for, 93; multiples of, 96–97
- Rosenthal’s centipede game, 401–402; with definite finite horizon, 514–15; reputation and incomplete information, 537–39, 541
- Rothschild and Stiglitz’ model of an insurance market, 630; game theory and, 649; worker self-selection model, 638–43
- Roy’s identity: firm’s cost maximization problem (FCMP), 252; Hicksian demand, 56–58
- Rubinstein’s model of bilateral bargaining, 556–65; basic result, with proofs, 557–60; dominance solvability and, 398n.6; incomplete information, 568–70; general issue bargaining, 560–61; results of, 563–65; variations, 561–63
- Runs, perfect competition and, 267–79
- Savage’s sure thing principle, 103–104
- Savage theory of choice: Ellsberg paradox, 117–18; representation and weaker alternative, 100–102; states of nature and, 99–100
- Scope of economic models, importance of, 10–11
- Screening equilibrium, game of incomplete information and, 478–80
- Search routines: long-run routine for, 734–35; theories of the firm, 723
- Securities, Arrow-Debreu contingent claim and, 220–23
- Self-interest: inefficiencies in unified governance, 756n.12; vs. opportunism, in transaction cost economics, 745–47
- Self-selection condition: menu of contracts and, 638–43; Spence’s job market signaling model, 633–34
- Semi-strict convexity of preferences, 34; Marshallian demand and, 40n.1
- Semi-strictly quasi-concave function and preference, 35
- Separating equilibrium: market signaling and, 648; as only possibility in menu of contracts model, 641–43; Spence’s job market signaling model, 633–38
- Separating hyperplane theorem, 162–64; dominance in non-cooperative game theory and, 397n.b; Pareto efficient allocation of social endowment, 201–202; trembling-hand perfection and, 439n.g

- Sequence: in extensive form game trees, 362–63; information sets in extensive form game trees, 368
- Sequential equilibrium: Bayes' rule and, 476–77; Cournot subgame given entrant's beliefs, 474–76; entry decision given entrant's beliefs, 476; games of incomplete information and, 472–73, 491–94, 538–39; knife-edge case, 540; market signaling and, 648; as Nash equilibrium refinement, 425–32; out-of-equilibrium beliefs and, 432; pooling equilibrium and, 478n.3; reputation and, 538–39; signaling games and, 435–36; trembling-hand perfection and, 441
- Sequential rationality, 427–32
- Service industries, monopolistic competition in, 345
- "Set-valued" solution concept, 443
- Shareholders behavior, profit maximization and, 726–28
- Shepard's Lemma: firm's cost maximization problem (FCMP), 252–53; profit function in neoclassical firm models, 241n.b
- Short-run cost curves, 256–58; transaction cost economics and, 759–61
- Short-selling, demand for assets and, 93–94
- Shut down ability, of neoclassical firm models, 235
- Signaling: quality of, in market signaling, 629–45; Spence's job market model, 632–38
- Signaling games: out-of-equilibrium beliefs and, 435–36
- Simple majority rule, Arrow's possibility theorem and, 175
- Simplex algorithm, direct revelation mechanism, 686
- Simultaneous move games, extensive form game trees and, 371–72
- Simultaneous offers, bilateral bargaining and, 552–54
- "Single-crossing" condition, 631; profit-maximizing insurance contracts and adverse selection, 664
- Single-party optimal contract design, 661–79; credibility problem, 677–79; profit-maximizing insurance contracts with adverse selection, 661–74; variations, extensions and complications, 674–77
- Sleeping patents, multigood monopolies and, 304–305
- Slutsky equation, 58–59; aggregate demand and, 63; comparative statics, 61–62; Giffen good and, 61; Hessian matrix, 61; Marshallian and Hicksian demand connection and, 58–59
- Social budget set, aggregate demand and, 63
- Social choice rule: Arrow's possibility theorem, 174–81; bibliographic notes on, 181; defined, 149, 174–75; interpersonal comparisons of preference intensity, 180–81; universal domain property, 176–78
- Social endowment: defined, 151; Pareto efficient allocation with Walrasian equilibrium, 199–200; private goods and, 165–67; public and private goods, 168–69
- Socially benevolent dictator, absence of, with Arrow's possibility theorem, 177–78
- "Social optimum," pivot mechanism and, 711–712
- Social outcome: commodity exchange and, 151–52; defined, 149; dicta-

- tors and welfare functionals, 156–64; Edgworth box, 152–53; efficient characterization of, 164–74; Pareto efficiency and optimality, 153–56; partial ordering of, 153–54; proof of Arrow's possibility theorem and, 178–81; syndicate theory and, 169–74; utility imputations, 150–51
- Social welfare functionals: defined, 159; range of possible choices for, 160–64; social choice and efficiency theory, 156–64; weakness in normative choice, 164–65
- Sophisticated choice with anticipated taste changes, 142
- Specialization: case of two outcomes and, 600–603; moral hazards and incentives, 593–95
- Spence's job market signaling model, 630, 632–38; game theory and, 645–49
- Split-the-dollar game: focal equilibria in bilateral bargaining and, 554–56; Rubinstein's models and, 556–65
- Spot market: Arrow-Debreu contingent claim and, 220–23; general equilibrium theory and, 219–20
- Stability concept, 442–43
- Stable equilibrium, 379–80
- Stream of payoffs, expected/discounted value of, 506
- Stream of rewards, folk theorem and, 505–506
- Strict concavity of preferences, 35
- Strict convexity of preferences, 34; comparative statics, 49n.9; concavity and, 35; local insatiability, 43–44; wage-education utility function, 630–31
- Strict dominance, in normal form games, 394–95
- Strict inequalities, moral hazard and incentives, 594n.c
- Strictly increasing utility function, 33
- Strictly mixed strategy, trembling-hand perfection and, 437–38
- Strictly monotone preferences, 33
- Strictly positive allocation, 31n.3; Pareto efficient allocation of social endowment, 200–202
- Strictly quasi-concave function and preference, 35
- Strictly quasi-convex function and preference, 35
- Strictly risk averse concept, syndicate theory and, 172–73
- Strict Pareto superiority, 153–54
- Strict preference: ac-
- Stable equilibrium, 442–43; market signaling and, 650
- Stage game, folk theorem and, 506
- State contingent commodity bundles (state contingent claims), 100
- State enterprise as productive sector, Walrasian equilibrium and, 194n.b
- Static choice, defined, 133. *See also* Comparative statics
- Stationary Markov decision problems in dynamic programming, 806–13
- Stationary strategies, dynamic programming and, 808
- Strategic equivalent representation, sequential equilibrium and, 431–32
- Strategic form games. *See* Normal form games
- Strategic risk aversion, transaction cost economics and, 764
- Strategies: dynamic programming and, 808–10; Nash equilibrium and non-cooperative game theory, 403–404; out-of-equilibrium beliefs, 434; sequential equilibrium and, 427, 430–32; sophisticated and efficient equilibria in repeated games and, 521–23; strategic form games,

- ceptable alternatives to, 25–26; asymmetric and negatively transitive, 23–24, 26, 74–76; axioms for, 74–76; GARP and, 43; pathways of, 22; uncertain future tastes and, 143; utility functions of, 30–32
- Subgame perfection: bilateral bargaining and, 553n.a; defined, 423–24; with definite finite horizon, 514–15; duopoly models and, 448; folk theorem and, 506n.c; game of incomplete information refinements and, 491–94; as Nash equilibria refinement, 421–25; punishment strategies and, 509–11; reputation and incomplete information, 542n.k; Rubinstein’s model bilateral bargaining, 557–60; Spence’s job market signaling model and, 646; trembling-hand perfection and, 440–41; unimprovable strategies and, 512; worker self-selection model and menu of contracts, 649n.9. *See also* Unique subgame perfection
- Subjective expected utility, 102;
- Anscombe and Aumann theory, 109
- Subjective probability, 73, 110–111; states of nature and, 98–111; utility theory and, 71
- Subjective reality, in extensive form game trees, 369n.d
- Subjective uncertainty, in Ellsberg paradox, 117
- Subject population, noncooperative games and, 387–88
- Substitute goods: multigood monopolies and, 304–305; role in maintaining monopolies, 304
- Substitutes, defined, 61
- Substitution axiom, in probability distributions, 75
- Substitution terms matrix, comparative statics and, 60–61
- Successive strict dominance in normal form games, 395
- Successors in extensive form game trees, 364–66
- Supergame concept, folk theorem and, 506
- Super-initial node, in extensive form game trees, 370–71
- Supply: curve, in Akerlof’s market for lemons model, 627–29; limits of game theory and, 530; and perfect competition, 267–79; profit-maximizing insurance contracts and adverse selection, 666; runs, examples of, 281–84; technology sets and, 253–55
- Syndicate theory, 169–74; bibliographic notes, 181; state-by-state sharing, 171–72
- Take-it-or-leave-it offers: nonlinear pricing and monopolies, 306–307; power of monopolies and, 314–17
- Takeover mechanism: bibliographic notes on, 740; profit maximization and, 725–26
- “Tangible uncertainty,” 569–70
- Tatonnement adjustment process, 196
- Taxes: effort incentives and, 579; general equilibrium with firms and, 288–91
- Team theory, human factors in transaction cost economics, 746–47
- Technological constraints, profit maximization and, 4
- Technology capability models of neoclassical firms, 234–39; input requirement sets and iso-quants, 236–38 production functions, 238–239; production possibility set, 234–36; profit and cost

- functions, 253–55
- Temporary general equilibrium, 216–23
- Terminal nodes, in extensive form game trees, 364
- Terms of governance, transaction cost economics and, 749–51
- Testable restrictions:
 - on consumer behavior, 4; on profit function, 247–50
- Test of dominated messages, 436
- Test of equilibrium domination, 436–37
- Theory building, process of, 9–10
- Theory of Games and Economic Behavior, 76
- Three-stage games, market signaling and, 650
- Time, Walrasian equilibrium and, 216–23
- “Tit-for-tat” strategy in repeated games, 513
- Total cost function:
 - monopoly and, 299, 311–12; nonlinear pricing and, 307–308
- Tournaments, incentives and, 610–11
- Toy problem: bibliographic notes on, 714; linear constraints and, 701–703; optimal contract design for, 681–84
- Transaction cost economics: bargaining costs, 759–61; bibliographic notes, 769; defined, 723–24; ex ante versus ex post incentives, 767–68; and firms, 743–44, 753–55; game theory and, 771–72; governance provisions and, 749–51, 755–56; human factors, 744–47; incomplete contracts and ownership, 757–59; markets and, 753–55; matching governance structures to, 751–53; mathematical models of, 756–68; qualities of transactions, 747–49; repeated play and, 761–64; reputation and firms, 764–67
- Transitivity: of preferences, 21; weak preference and indifference, 23–24
- Trembling-hand perfection: game of incomplete information and, 494n.g; noncooperative game theory and, 437–41
- Trigger equilibria: implicit collusion and, 527–28; in repeated games, 517–21; sophisticated and efficient equilibria in repeated games and, 521–23
- Trilateral relationships: in auditing procedures, 763–64; firms and reputation, 764n.f; transaction cost economics, 750–51, 761–62
- Truth game, 433–34; games of incomplete information and, 468
- Truth-telling: direct revelation mechanism, 686–91; multiple equilibria and dominant strategy implementation, 697–700; pivot mechanism and, 707–710; revelation principle and mechanism design, 693–97; in toy problem, 682–84, 701–703
- Twice-continuously differentiable function, 60
- Two-by-two outcome space: dynamic choice and, 137n.1
- Two-player games: dominance in, 397n.b; zero sum games, 401n.7
- Uncertainty: Allais paradox and, 116; asymmetric preferences and, 19–21; bibliographic notes, 122–23; in contracting, 752; dominance solvability and players’ rationality, 398–99; dynamic choice and, 136–39; Ellsberg paradox and, 116–17; empirical evidence in simple settings, 115–18; extensive form game model of, 356–63; extent of, and quality of transactions, 747–49; financial

- assets and, 93–98;
firm as maximizing entity and, 730;
framing and, 117–18; future consumer preferences and, 142–43; Harsanyi doctrine, 110–111; induced preferences for income, 88–89; insurance and, 91–93; limits of choice models under, 112–20; market demand applications, 87–98; modeling irrationality and, 482–89; Nash equilibria weak dominance refinement and, 419–21; normative applications of choice theory and, 120–22; player's rationality and backwards induction, 402; precedence in decision trees and, 358–59; prices and induced preferences, 90–91; profit maximization and firm theory, 729; resolution tree for, 218–29; states of nature and subjective probability, 98–111; temporal resolution of, 113–15; theoretical problems with models, 112–15; validity of models in complex settings, 118–20; Walrasian equilibrium and, 193–94, 216–23
Uncertainty. *See also* Fair certainty concept
- Unconstrained optimization, intuition and, 783–84
- Undifferentiated goods: Bertrand equilibrium, 330–35; perfect competition and, 264
- Unification of theory, process of, 9–10
- Unified governance structure, 751
- Unimprovable strategies: dynamic programming and, 812–13; infinite horizon dynamic programming, 801–806; repeated games and, 512; trigger equilibria and, 518–19
- Uniqueness: in noncooperative game theory, 414–16; predecessors in extensive form game trees, 365–66; Rubinstein's model of bilateral bargaining, 561; in subgame perfection; 563–65
- Unit elasticity in monopolies, 300
- Unit of probability, alternating offer bargaining, 567
- Universal domain property, of social choice rule, 176
- Universally divine equilibria, 437
- Unlimited rationality, choice models, 119
- Upper semi-continuous aggregate demand, 210; consumer preferences, 40n.k
- Utilitarian social welfare functional, 159
- Utility function:
Anscombe and Aumann theory, 107–110
certainty equivalents and, 83–84; of consumer preferences, 4; dual consumer problem and, 47–48; dynamic programming and, 793n.1; Harsanyi doctrine, 110–111; indirect, 45–46, 57–58; induced preferences for income, 88–89; infinite horizon dynamic programming, 801–806; for money, 81–86; nonlinear pricing and, 306; pivot mechanism and, 704–705; of risk averse agents, 583–84; Rubinstein's model bilateral bargaining, 561; "take or leave" provision in nonlinear pricing, 308; uncertainty and, 123; of wages and education, 630–31
- Utility imputations of social outcomes, 150–51; Pareto efficiency and, 154; Pareto frontiers, 154–55
- Utility representations of consumer preference, 30–32; expected, 76
- "Valuation gaps," in

- Akerlof's market for lemons model, 627
- Value functions, dynamic programming and, 808–10
- Value iteration, dynamic programming and, 811–12
- Value of prizes, state of nature and, 102
- Variable costs, as long- and short-run costs, 256–57
- Vector of past consumption, finite horizon dynamic programming, 800–801
- Von Neumann-Morgenstern expected utility, 76–77; absolute and relative risk aversion, 84–87; agent's reservation level of utility, 580; Allais paradox, 116, 118; Anscombe and Aumann theory, 108–110; coefficient of risk aversion and, 85–86; defined, 71–72; demand for insurance and, 91–93; dynamic choice and, 136–39; empirical evidence in simple settings, 115–18; extensive form games and, 373n.3; financial assets and, 93–98; finite actions and outcomes, 586–87; finite horizon dynamic programming, 791–96; induced preferences for income, 87–91; preference axioms, 74–76; preference representation, 76–81; social choice rules and, 180–81; strategic form games, 378–79; structure of, 72–74; theoretical problems with, 111–15; validity in complex settings, 118–20
- Von Stackelberg equilibrium: correctness of, 338–40; implicit collusion in oligopoly and, 525–26; limits of game theory and, 529; noncooperative game theory and, 444–49; reputational equilibria and, 535–36
- Wage-education utility function: game theory and job market signaling model, 648–49; nonequilibrium levels, 635–36; pooling equilibrium, 637–38; Spence's job market signaling model, 633–35; worker self-selection and menu of contracts model, 641–43
- Wages: basic marginal utility, 592–93; as effort incentives, 580–81; expected utility of, 588–89; riskless, 583–84
- Wage-utility levels: in finite actions and outcomes, 587–88
- Walrasian auctioneer, 195–96
- Walrasian equilibrium: bibliographic notes on, 224; bilateral bargaining and, 570; convexity of Pareto efficient allocation, 200–202; defined, 190–92; Edgeworth box and, 190–92; efficiency of, 199–205; existence and, 206–213, 291–92; experimental evidence for, 198; externalities, 202–205; finiteness and local uniqueness, 214–16; in firms, 285–86, 291–92; nonexistence of, with demand correspondences, 210–11; Pareto efficient allocation of social endowment, 199–200; prices and, 193–98; time and uncertainty and, 216–23
- Walras' law: aggregate demand and, 63; Marshallian demand, 41–42, 62
- Weak dominance: backwards induction compared with, 399–400; mechanism design and, 702n.j; Nash equilibria refinement and, 418–21; in normal form game theory, 397–98; trembling-hand perfection and, 439–40
- Weak preferences:

- GARP and, 43; indifference and, 22–24; pathways of, 22; probability distributions, 75; uncertain future tastes and, 143
- Weighted utilitarian social welfare functional, 159
- Welfare economics: first theorem for, 199–200; second theorem for, 200–202
- Welfare theorems: externalities, taxes and efficiency, 289–91; in general equilibrium economy, 286–88
- Wilson anticipatory equilibrium model, 644–45
- Worker-managed firm, as maximizing entity, 730
- Worker self-selection model and menu of contracts, 638–43; game theory and, 649
- y-output iso-quant, input requirement sets, 238
- Zero-conditional-mean noise, risk aversion and, 83
- “Zero illusion,” normative applications of choice theory and, 121–22
- Zero prices: in monopolies, 300n.a; and zero revenue, 275n.5
- Zero probability: modeling irrationality and, 487–88; sequential equilibrium and, 427
- Zero profits: Bertrand equilibrium and, 333–35; long-run equilibrium and perfect competition, 273–79; reactive equilibrium and game theory, 650; revelation principle and mechanism design, 692n.g; Walrasian equilibrium economy and, 288; worker self-selection and menu of contracts, 633–34
- Zero utility, Rubinstein’s model and, 561
- Zero weights, concavity and social welfare functionals, 160–62
